

# Axis Scientific Classic Human Skeleton Assembly Guide

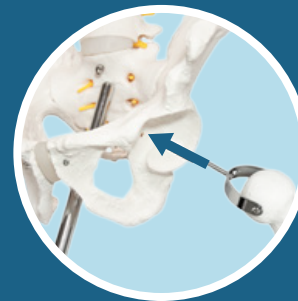

**Step 1:** Insert the black pole into the top of the base with the portion containing the black screw on top.

**Step 6:** Screw on the black screw that was previously removed. This will secure the skeleton.

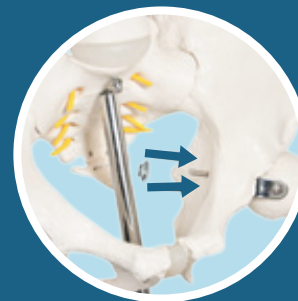

**Step 2:** Slide legs onto base piece. Be sure to slide the leg all the way in.

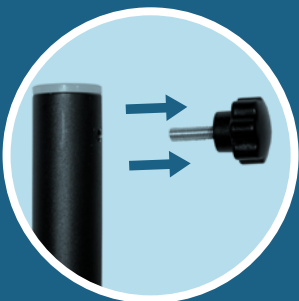

**Step 7:** Attach the legs by placing the included screw into the femur bracket, screw threads facing outward. Then insert the end of the screw through the hole in the pelvis.

**Step 3:** Once all 5 legs are on, flip over the base. Insert casters into the hole located on the bottom of the leg.

**Step 8:** Screw the nut onto the other side to secure the leg. Repeat on other side.

**Step 4:** Unscrew the black screw at the top of the pole to allow the base of the skeleton to be inserted.

**To Complete:** Attach the skull. There is a pin that goes through the top of the skull and can be seen inside. This must be inserted into the rod at the top of the spine.

**Step 5:** Insert pelvic rod into the top of the stand.

**Got a bone to pick with the skeleton in your closet? If you've got an issue with your product, come to us first:**
